STEM CELL INSTITUTE

Retinopathy

Overview

Retinopathy or Retinitis Pigmentosa, is the most common condition that is a progressive, degenerative disorder affecting the retina of the eye. It particularly affects the light sensitive cells of the retina known as strong rods. They are capable of sending the info to the brain regarding every minuscule detail of your visualization via the assistance of optic nerves. Retinitis Pigmentosa is characterized by the vicissitudes in the pigment owing to the resultant degeneration of optic nerves. This in turn is connected with thinning of retinal blood vessels as the demand of blood supply lowers significantly. The prevalence of this disorder is related with the genetic deficiency. Retinopathy stem cell treatment in India is considered a befitting procedure that works towards providing optimum results. It is believed that out of many genes accountable for the normal eye functioning, one faulty gene can causes this type of retinal malformation. Stem cell treatment for retinopathy in Delhi is aided by experts under the supervision of subject matter expert.

In natural circumstances, insulin removes glucose from the bloodstream. This process does not work in people with diabetes mellitus because of insulin tolerance or poor insulin production. This causes glucose to build up in the bloodstream, which can weaken blood vessels over time. They're in danger of rupturing the blood vessels that have been destroyed. However, this will have an effect on different areas of the body.

Symptoms

Distorted
vision

Fluctuating
vision

Impaired
vision in
colour

In your vision,
dim or vacant
places

Lack of vision

Cause

Over time, too much sugar in your blood can lead to the blockage of the tiny blood vessels that nourish the retina, cutting off its blood supply. As a result, the eye attempts to grow new blood vessels. But these new blood vessels don't develop properly and can leak easily.

Diagnosis

- Visual field test
- Fluorescein angiography
- Optical coherence tomography (OCT)

Adverse Reaction

We comprehend that patients might have apprehensions about adverse reactions to the treatment. Possible side-effects of stem cell therapy may differ from individual to individual; any complications depend upon the type of processes you are undergoing.

Side-effects experienced by our patients are consistent with predictable reactions for routine IV and LP injections. The most common reactions to the treatment are fever, headache, diarrhea, leg pain, vomiting and allergic reactions. Less than four percent of patients experience any of these signs.

The most common reactions to the stem cell treatment are:

Fever

Headache

Leg Pain

Diarrhea

Vomiting

Allergic reactions

Vieze
STEM CELL INSTITUTE

Treatment Procedure

The Viezec India offers a very safe and non-invasive treatment protocol and procedure. The patients can travel the next day. The following is the day-wise schedule for the patients.

Day 1-

- Pick up from the Airport to the Hospital
- Interaction between Dr and Patient, to clear all their doubts at that time
- Admission procedure
- Clinical examination & Lab test will be done prescribed by the doctor

Day 2-

- Stem cell Procedure
- Supportive therapies
- Physiotherapy

Day 3-

- Supportive Therapy
- Physiotherapy
- Discharging formalities
- Drop back to the Airport

International Patient Facilities

Quote/treatment plan
Complimentary airport pick up
Scheduling of all medical appointments
Cost estimates for anticipated treatment

Visa assistance letter
Dedicated guest relation officers
Coordination of the admissions process

Treatment

The majority of the cases of AMD involve the slow-developing type of AMD, called dry AMD. Currently, as of 2020, there are no treatment options available for dry AMD, but some promising new therapies are in it. The slow-developing form of AMD, called dry AMD, constitutes the majority of AMD cases. There are no treatment options currently available for dry AMD as of 2022, but some exciting new treatments are in the pipeline.

For all aspects of medicine today, including multiple cases of cancer, as well as for dry AMD, stem cell treatment is gaining momentum. The aim of stem cell treatment for AMD is to be able to replace retinal cells that have been damaged or killed by symptoms with new stem cells.

Stem cells are also inserted, through IV infusion, into the blood supply of the body. But, experts are focusing on how the stem cells can be transplanted directly into the eyes. One strategy involves placing the stem cells into a fluid suspension that can be injected under the retina

We use the unique technology of Mesenchymal stem cells extracted from Wharton's jelly (WJ) for treating MS. WJ-MSCs offer remunerative and budget friendly favorable treatment for tissue engineering purpose. An optic nerve stem cell regeneration aids this and more. They might help in the three peculiarly prominent ways – prevent damage, repair damage and develop new medicines.

The treatment will take place in multiple steps comprising of the following.

•**Qualification for the treatment:** Our experts will assess all your past medical history and symptoms to examine and correctly judge the severity of your condition. A series of tests will be performed to gain a knowledge of the stage of disease. As per the test results, our experts will counsel the patient for further process of the procedure.

•**Source Extraction:** With guidance and approval from the physician, the source of extraction will be decided. In general, WJ-MSCs are the most potent allogenic sources available. Stem cells from a healthy person (the donor) are transferred to the patient's body. A bone marrow donor is considered for allogenic stem cell transplantation. A scraping from the inside of the patient and his or her sibling's cheek is tested to determine tissue type. An expert will examine to identify Human Leukocyte Antigens (HLAs). If the HLA on the donor cells are identical or similar, the transplant is more likely to be successful. Stem cell for optic nerve atrophy is promoted to aid patients suffering from similar kind of ailment.

•**Laboratory Processing:** The extracted samples will be sent to government approved cGMP laboratory for processing. The sample manipulation will take place in a state-of-the-art facility in compliance with the ISO and GMP standards and using the latest technologies. The client will receive a third party certificate from an internationally accredited lab for quality purpose. An optic nerve stem cell therapy provides just that and more.

•**Stem Cell Implantation:** Once the stem cells are ready to be implanted, the doctor will identify the most potent method of infusion based on the patient's physical and mental well-being. The only limitation of the allogenic stem cell treatment is that this procedure carries the risk of developing Graft vs. host disease (GVHD), wherein the patient's body rejects the donor stem cells. Human leukocyte antigens (HLA) can help minimize the risk of any side effects. In this procedure, the HLA of the patient and the donor are primarily matched as closely as possible.

Stem cell treatment Aftercare: The patients will be asked to visit the doctors for evaluation. You will be provided counselling for speedy recovery and also kept on check to ensure that no side effects affect the human body.

Stem cells can help restore the weakened retina and can contribute to a complete halt in the process of loss of vision, thus enhancing the general quality of life of humans. The new doors to the cure and changes in Macular Degeneration patients have been opened through Stem Cell Therapy.

Program for Stem Cell Therapies to treat multiple diseases. Each patient receives 200-300 million stem cells during the stem cell procedure. Not only does the sum of stem cells compensate everyday losses, but it beats them by a million times. The stem cell source, which has basically been missing for the last 15 to 20 years, is thus retrieved and revived. Different organs get rejuvenated following our stem cell injection, and they get revived when the new and activated stem cells replace the old ones fully.

Introduced into the retrobulbar space, stem cells may start to work on damaged tissue and begin to rejuvenate the optic fibers and retinal cells. Photoreceptors and other cells can be differentiated from mesenchymal stem cells. It is possible to use segregated stem cells to treat tumors in the macular and retinal cells.

Mechanism

- ❑ • There are three stem cell classes that vary, based on their position in the body and their potency (the ability to develop in different cell lines). Ophthalmologist performs experiments on both of these classes. Embryonic stem cells (ESCs) are cells that are found at an early stage of development in the inner cell mass of an embryo. ESCs are pluripotent, meaning that in the course of growth they will become any cells.
- ❑ Fetal stem cells. Following an abortion or from cord blood, this community of cells is removed from the fetus. Fetal SCs have greater functionality than adult SCs and are pluripotent. Such cells exhibit increased recovery rates of photoreceptors and are capable of sustained doubling during cultivation. Their use, however, is often synonymous with ethical concerns. Study on fetal cells is banned by law in many countries worldwide.
- ❑ Adult stem cells, found in mature tissues, are immobile and non-specialized cells. Adult SCs collaborate with new ones to replace dead cells and facilitate tissue regeneration. Nonetheless, they create a microenvironment for tissues, shield them from degeneration (destruction), and also have the capacity to self-renew and create mature cells. Hematopoietic stem cells, mesenchymal stem cells, and neural stem cells may be differentiated by multiple forms of SCs.
- ❑ Relevant antigens, which are a common cause of incompatibility between donor tissues and the recipient during transplantation, are still not generated. ESCs may be useful in managing retina degenerative disorders, retinal pigment epithelium pathologies, and optical neuropathies. Research on ESCs is banned at the regulatory level in many countries, as their extraction from the embryo interrupts its further production.

Patient Testimonials

Florence L. Buse (California, US)

I'm proud to announce that I've been a patient of Viezece for three months now, and I'm already seeing great results. I was diagnosed with Retinitis Pigmentosa and knew that stem cell is a viable treatment but they were too expensive in my country. Now, thanks to Viezece's affordable and international quality treatment, I'm seeing the world in a whole new light. I've never felt more hopeful!

Thury Csongor (Erzsébet, Hungary)

Treatment using Stem Cells at Viezece is an effective, affordable treatment for Retinitis Pigmentosa. I have been administered with them for a couple of months and I can already see the results. The treatment is much less painful than other treatments I've tried and works very rapidly.

Celina Wysocka (Zielona Góra, Poland)

I have retinitis pigmentosa, a degenerative eye disease that destroys the light-sensitive cells in the retina. It is progressive, degenerative and incurable. I was told that I would eventually go blind. Well, I started stem cell treatment and what was once a blurry world is now sharp and clear. I can see the leaves on the trees again and see my grandson's face. I can see my husband's face and the love in his eyes clearly once again. I am grateful to the stem cell treatment and the wonderful people at Viezece who have made this possible.

SHAUNA FULLARD
came USA for MS with Neuromyelitis Optica & amp ONA Treatment

My name is Shauna Fullard and I have come from America to take stem cell treatment for treating Neuromyelitis Optica & amp ONA disorder. Earlier, I took chemotherapy and several other treatments, but I didn't get any benefit. After taking stem cell treatment, my condition is stable. I'm satisfied with this effective treatment.

MRS SWARALIPi DASH SAHA
came from West Bengal for Diabetes Mellitus, Neuropathy and Retinopathy Treatment

Since the age of 14, I've been dealing with the effects of diabetes. Since then, I've been plagued by a variety of different neurological issues. All kinds of aches and pains began to manifest themselves in my feet. Due to diabetic neuropathy, I also had vision problems. Last year, I had a retinal detachment surgery. It was my last hope that stem cell therapy might help me. My stay here has exceeded my expectations in terms of both the service and the warmth. The group works well together.

SARMAND JUTYAR BABANI
came Australia for Neuropathy Treatment

Two years ago, I was diagnosed with lower disc pain. I'd tried everything from physiotherapy to pills to no avail. It was just a band-aid solution. After considerable investigation, I discovered that India offers stem cell therapy. My therapy began as soon as I arrived. I'm relieved, but I hope it lasts.

Improvement

It's frightening to envision a life without a clear central goal, but there's reason to be hopeful. Doctors are also searching at ways to improve patients with this condition, and they're researching experimental therapies that may one day be used as a therapy. For instance, stem cell development is currently ongoing, with the potential to lead to a cure in the future.

Before these groundbreaking therapies become a reality, it's important to speak with an experienced doctor who will guide you through current procedures for the type of macular degeneration you have already. We have physicians available to work with you, and our doctors will use cutting-edge procedures to keep your eyes as healthy as possible. Patients' effects have changed as a result of stem cell therapy provided by Stem Cell Treatment India.

Our Promise

It's frightening to envision a life without a clear central goal, but there's reason to be hopeful. Doctors are also searching at ways to improve patients with this condition, and they're researching experimental therapies that may one day be used as a therapy. For instance, stem cell development is currently ongoing, with the potential to lead to a cure in the future.

Before these groundbreaking therapies become a reality, it's important to speak with an experienced doctor who will guide you through current procedures for the type of macular degeneration you have already. We have physicians available to work with you, and our doctors will use cutting-edge procedures to keep your eyes as healthy as possible. Patients' effects have changed as a result of stem cell therapy provided by Stem Cell Treatment India.

Post Treatment Care

Postoperative care

The stem cell therapy does not damagingly affect patients in any way. Generally, the patients are permitted to leave after few hours after the completion of the stem cell treatment. A 24-hour patient hotline number is there for any inquiries after their discharge. The concerned physicians or surgeons of the clinic also stay in contact with their corresponding patients through telephone or email. By doing this, they can get the precise feedback about their progress and also suggest further recovery if required. Say for example, in case of a diabetic patient, after hearing about the patient's present symptoms, the concerned doctor can recommend the needed dosage of insulin.

Treatment disclaimer

It is an imperative fact to comprehend that stem cell treatment in every prospect has the ability to diminish symptoms of numerous diseases. It also has the aptitude of ceasing several degenerative procedures, but one should also know that this treatment may not work for all kinds of patients. Viezec does not have the right of forecasting or warranting the success of this treatment.

In harmony to the current condition of a patient, the medical team of Viezec might propose the stem cell transplantation or may even withdraw the treatment under abnormal situations. However, in any case, the approval of the patient is a must. Keeping the patient's current health condition and unforeseen health hazards in mind, the medical staff might propose an alternative stem cell transplantation process. In exceptional situations, they may entirely cancel the treatment.

Do I need to habitually examine my eyes?

Yes, it is always advisable to check your eyes frequently. Young adults between the age group 20-39 should have their eye checkups after every 3-5 years. Whereas grown-ups between the ages group 40-64 should have their eye checkups after every 2-4 years. In case of senior citizens above 65 years of age, ophthalmic visit has to be once a year. Regardless of age groups, some individuals congregated under the category of high risk adults should also visit ophthalmologist once a year such as folks with diabetes, strong family history of glaucoma, persons with AIDS, etc.

Will working at a computer screen or sitting close to TV screen harm my eyes?

No, there is not yet any scientific indication that these instruments release rays that can be dangerous to the eyes, however long working hours can be worrisome, and hence it is often useful to take episodic breaks, looking off in the distance etc.

Sometimes I notice dark patchy spots or floaters particularly on the white surface. Can this be the reason for me to worry?

These are the common eye complications which are signs of retinal or corneal malfunctioning. It is always desirable to visit the doctors as timely as possible. Retinopathy stem cell treatment can help you cure the disease.

I have gradually found it harder to read without glasses. Why?

The capability to focus on near objects declines with age and is referred to as presbyopia. The condition is recognized as a natural aging procedure of the optic lens. The condition is often unalterable with conventional treatments. However, retinopathy stem cell treatment in India can to some degree reverse the impairment naturally with complete stoppage of more progression.

Is my kid likely to inherit some eye problems?

Yes, some of the eye sicknesses such as glaucoma, photophobia etc. are witnessed to be directly connected up with a hereditary abnormality which can either be genetic or mutational. However, some of the common eye issues such as burns, corneal damage, etc. are associated with environmental impairment.

Can eyes be transplanted?

No, there are no confirmations that affirms the transplantation of the whole eye, however portion of the eye can be replaced if an apt donor is found via eye stem cell transplant.

Can stem cell treatment treat my damage?

Yes, stem cells are the unspoiled cells of the body, which can give rise to several diverse kinds of cells once they get appropriate signaling. In case of eye disorders, these cells have shown amazing improvements by segregating into photoreceptor cells, rods and cones cells of the inner eyes, optic nerve cells, etc.

As a stem cell company at the cutting edge of Regenerative Medicine, Viezec is dedicated to developing technologies and protocols for safe and effective treatments utilising adult stem cells derived from the umbilical cord.

StemCellCareIndia offers a comprehensive range of stem cell solutions in India for the treatment of different kinds of diseases. Our main focus is helping people get back to good health through stem cell treatment. We have association with the leading hospitals, research institutions and medical colleges specialising in regenerative medicine to offer cost – effective healthcare.

Around the world, emerging technologies and advancements in stem cell therapies are driving major changes in healthcare. With the use of potent mesenchymal stem cells isolated from the tissue of umbilical cord, damaged cells are replaced by new cells. This makes the symptoms of the diseases disappear. We are passionate about the latest developments in stem cell therapies and strive to deliver safe and effective treatment options to patients' world over at the highest medical standards.

As the leading stem cell therapy company, StemCellCareIndia takes care of each and every section of the Medical Trip to New Delhi. We ensure our patients get the best healthcare service by bringing in place, the renowned multispecialty hospitals, latest stem cell treatments, economical accommodations and travel options for the patients.

VISION

Our vision is to provide effective healthcare services to patients all over the world fast and hassle-free. For this, we work closely with some of the best medical centres and research institutions in providing stem cell therapeutic solutions to our patients. Our work is to redesign and deliver the best treatment possible for the safe and fast recovery of patients and make their journey towards 'good health' as stress-free as possible.

MISSION

Our mission is to provide the international patients visiting in New Delhi, the satisfaction of best treatment for any kind of disease. The face of healthcare has changed over the years and so, have the healthcare costs. We have a professional team that takes care of every need of international patients, from appointment to accommodation. Through our network of internationally accredited hospitals and research clinics, we provide reliable and bespoke assistance. Seeing patients getting healthier and happier is what make us happy.

EYE DISORDER

Our eyes are one of the most significant organs in our body. Through it, we are able to see things and do our errands efficiently. The human eye is a complex yet imperative organ of our body filled with nerves, a lens, liquid and more. This organ gives us the aptitude to envisage the world in different colors, shapes and dimensions; centered on the reflection and refraction norm. In our eye, several major constituents work concurrently to capture and transmit the image to the occipital lobe of the brain through optic nerves. Separate info from left and right eye is directed to the brain through these nerve impulses. This info is then combined by our brain for determining the distance and profundity of the image so as to envisage full three dimensional images. The upward and downward muscular movement of the eye is monitored by superior and inferior rectus muscles, whereas the side movement and staying in level is controlled with the assistance of medial and lateral rectus muscles. These muscles are in turn controlled over with the aid of oculomotor nerves. To prevent the frictional impairment from these movements, the tears are released by lacrymal glands, which can improve lubrication, confiscate foreign objects and avert bacterial infection.

Occipital lobe is the portion of central nervous system, accountable for deciphering vision. Thus, any impairment to optic nerve can sternly affect central vision, peripheral vision and color vision of an individual. The functional aberration in any of the above major constituents might cause serious eye glitches; which if overlooked, might gradually result in vision loss. Thus, there are a number of eye conditions such as retinopathy or some forms of corneal sicknesses, which can be very upsetting for some of the patients; where as some of the other disorders can be so subtle that they can be routinely treated by an ophthalmologist.

SUPPORTIVE THERAPIES

Viezec is unlike any other stem cell treatment provider in the world, the reason? Since its inception, we have been developing and enhancing our stem cell treatment protocols with the notion that stimulation via a number of supportive therapies is essential to augment stem cell regenerative response. Our treatment methodology permits our patient to maximize their improvements. Learn more about the diverse therapies provided in our treatment practices.

ACUPUNCTURE

Acupuncture is a method in which practitioners stimulate particular points on the body – most often by inserting thin needles via the skin. It is one of the most effective practices used in old-style Chinese medicine. Acupuncture arouses nerve fibers to convey signals to the spinal cord and brain, stimulating the body's central nervous system. The spinal cord and brain then release hormones accountable for making us feel less pain while improving overall health. Acupuncture might also: upsurge blood circulation and body temperature, affect white blood cell activity (responsible for our immune function), decrease cholesterol and triglyceride levels and normalize blood sugar levels.

EPIDURAL STIMULATION

Epidural stimulation has aided preceding patients to recoup some voluntary motor function. The technology comprises of a device implanted in the epidural space which constantly delivers electric signals to the spinal cord. These electric signals mimic the ones that are delivered by the brain to voluntarily control the body's movements. The epidural stimulation device is offered by Medtronic.

AQUA THERAPY

Aquatic Physical Therapy is the practice of physical therapy in a specially designed water pool with a therapist. The exceptional properties of the aquatic environment augment interventions for patients with neurological or musculoskeletal conditions. Aquatic therapy embraces a widespread variety of techniques permitting patients to improve their balance, muscle strength and body mechanics. Aquatic therapy works to boost the rehabilitation process and support efficiency of stem cell treatment.

HYPERBARIC OXYGEN THERAPY

Hyperbaric Oxygen Therapy (HBOT) is the medical use of oxygen at a level upper than atmospheric pressure. The equipment necessary comprises of pressure chamber, which might be of rigid or flexible construction, and a means of supplying 100% oxygen into the respiratory system. Published research shows that HBOT upsurges the lifetime of stem cells after inoculation and offers an oxygen-rich atmosphere for the body to function at optimal levels.

NERVE GROWTH FACTOR (NGF)

Nerve growth factor (NGF) is a member of the neurotrophic factor (neurotrophin, NTFS) family, which can inhibit the death of nerve cells and has several features of typical neurotransmitter molecules. NGF plays an imperative role in the development and growth of nerve cells. NGF is synthesized and secreted by tissues (corneal epithelial, endothelial, and corneal stromal cells), and it can be up-taken by sympathetic or sensory nerve endings and then conveyed to be stored in neuronal cell bodies where it can encourage the growth and differentiation of nerve cells. NGF can exert neurotrophic effects on injured nerves and promote neurogenesis (the procedure of generating neurons from stem cells) that is closely related to the development and functional maintenance and darning of the central nervous system. It is also adept of encouraging the regeneration of injured neurons in the peripheral nervous system, improving the pathology of neurons and guarding the nerves against hypoxia (lack of oxygen)/ischemia (lack of blood supply).

TRANSCRANIAL MAGNETIC STIMULATION

Research has shown that TMS can efficiently treat symptoms of depression, anxiety, neurological discomfort, stroke, spinal cord injuries, autism and more. This process is very simple and noninvasive. During the process, a magnetic field generator or “coil” is placed near the head of the individual getting the treatment. The coil produces small electrical currents in the area of the brain just beneath the coil via electromagnetic induction. This electrical field causes a change in the trans membrane current of the neuron which results in depolarization or hyper polarization of the neuron and the firing of an action potential.

OCCUPATIONAL THERAPY

Occupational therapy interventions concentrate on adapting the environment, revising the task and teaching the skill, so as to upsurge participation in and performance of everyday activities, predominantly those that are meaningful to the patient with physical, mental, or cognitive maladies. Our occupational therapists also focus much of their work on detecting and eradicating environmental barriers to independence and participation in day-to-day activities, akin to everyday life.

PHYSIOTHERAPY

Physical therapy or physiotherapy (often truncated to PT) is a physical medicine and rehabilitation specialty that, by using mechanical force and actions, remediates damages and promotes flexibility, function and quality of life via examination, diagnosis, prognosis and physical intervention. We combine our PT with stem cells for supreme physical rehabilitation improvements.

NUTRITION THERAPY

Medical nutrition therapy (MNT) is a therapeutic methodology to treat medical conditions and their related symptoms by the usage of a specifically tailored diet formulated and monitored by a specialist. The therapy targets at fixing nutritional inefficiencies and physiological imbalances so as to provide the best environment possible for the stem cells to develop appropriately as well as improving patient's general health.
